- 1. (20 pts) Parts (a) and (b) are not related.
  - (a) For  $f(x) = \frac{1}{x^2}$  and  $g(x) = \frac{1}{p(x+2)}$ , identify the composite function (f g)(x) and its domain. Express the domain in interval form.

$$(f \ g)(x) = f(g(x)) = f \ p \frac{1}{x+2} = p \frac{1}{x+2}^{2} = (p \frac{1}{x+2})^{2} = x+2$$

The domain of f g is the set of all x in the domain of g such that g(x) is in the domain of f.

Domain of *g*: x + 2 > 0 ) x > 2

For each x in the interval (2; 7), g(x) is in the domain of f (since  $g(x) \neq 0$  for all x t/oJTalk t/oJTall

(b) The graph below depicts a function of the form  $y = h(x) = a \sin(bx) + c$ . Determine the values of *a*, *b*, and *c*. (*Hint:* Consider the transformations from the graph of  $y = \sin x$  to the given graph.)

## Solution:

Begin with the graph of the relevant base curve,  $y = \sin x$ :

The profile of the given curve over the interval [0; ] is the same as the profile of the  $y = \sin x$  curve over the interval [0; 3]. Therefore, the given curve has experienced a horizontal compression of a factor of 3 with respect to the  $y = \sin x$  curve, which implies that b = 3

The vertical difference between the given curve's maximum and minimum values is 1 (3) = 4, while the vertical difference between the  $y = \sin x$  curve's maximum and minimum values is 1 (1) = 2. Therefore, the given curve has experienced a vertical expansion of a factor of 2 with respect to the  $y = \sin x$  curve, which implies that a = 2

The vertical center of the given curve is y = 1 while the vertical center of the  $y = \sin x$  curve is y = 0. Therefore, the given curve has experienced a downward vertical shift of 1 unit with respect to the  $y = \sin x$  curve, which implies that c = 1

Therefore, the function depicted in the given graph is  $y = 2 \sin (3x) - 1$ 

- 2. (30 pts) Evaluate the following limits. Support your answers by stating theorems, definitions, or other key properties that are used.
  - (a)  $\lim_{x \neq 0} \frac{\tan x \sin (2x)}{x^2}$

**Solution:** Key property:  $\lim_{t \to 0} \frac{\sin}{t} = 1$ 

$$\lim_{x \neq 0} \frac{\tan x \sin (2x)}{x^2} = \lim_{x \neq 0} \frac{\tan x}{x} \quad \frac{\sin (2x)}{x}$$
$$= \lim_{x \neq 0} \frac{\sin x}{x \cos x} \quad \frac{2 \sin (2x)}{2x}$$
$$= \lim_{x \neq 0} \frac{\sin x}{x} \quad \frac{1}{\cos x} \quad \frac{2 \sin (2x)}{2x}$$
$$= \lim_{x \neq 0} \frac{\sin x}{x} \quad \lim_{x \neq 0} \frac{2 \sin (2x)}{2x}$$
$$= \lim_{x \neq 0} \frac{\sin x}{x} \quad \lim_{x \neq 0} \frac{2}{\cos x} \quad \lim_{x \neq 0} \frac{\sin (2x)}{2x}$$
$$= [1] \quad \frac{2}{1}$$

(b) 
$$\lim_{x/9} \frac{p_{\overline{x-5}}}{x-9}$$

Begin by multiplying the numerator and the denominator by the conjugate of the original numerator expression.

$$\lim_{x/9} \frac{p_{\overline{x-5}}}{x-9} = \lim_{x/9} \frac{p_{\overline{x-5}}}{x-9} = \frac{p_{\overline{x-5}}}{x-9}$$

x9d 99 + J20.436 w9091 TF 30918592.901 11TF[(5)-221(+)-222(2) 1T46 w2 52.901 [(9) 1TJ/F34 10.9091 TF 2

- 3. (30 pts) Consider the rational function  $r(x) = \frac{x^2 5x + 4}{2x^2 8x + 6}$ .
  - (a) Identify all values of x at which r(x) is discontinuous. At each such x value, explain why the function is discontinuous there.

$$r(x) = \frac{x^2 \quad 5x + 4}{2x^2 \quad 8x + 6} = \frac{(x \quad 1)(x \quad 4)}{2(x \quad 1)(x \quad 3)}$$

Since r(x) is a rational function, it is continuous at all x in its domain.

(c) Find the equation of each vertical asymptote of y = r(x), if any exist. Support your answer in terms of the limits you evaluated in part (b).

#### Solution:

The finite value of  $\lim_{x \neq 1} r(x) = \frac{3}{4}$  determined in part (b) indicates that there is no vertical asymptote at x = 1.

The infinite limits  $\lim_{x \neq 3} r(x) = 1$  and  $\lim_{x \neq 3^+} r(x) = 1$  were determined in part (b). Either one of those limits being infinite is sufficient to conclude that the line x = 3 is a vertical asymptote of the curve y = r(x).

(d) Find the equation of each horizontal asymptote of y = r(x), if any exist. Support your answer by evaluating the appropriate limits.

#### Solution:

$$\lim_{x \neq 1} r(x) = \lim_{x \neq 1} \frac{x^2}{2x^2} \frac{5x+4}{8x+6} = \lim_{x \neq 1} \frac{x^2}{2x^2} \frac{5x+4}{8x+6} \frac{1=x^2}{1=x^2}$$
$$= \lim_{x \neq 1} \frac{1}{2} \frac{5=x+4=x^2}{8=x+6=x^2} = \frac{1}{2} \frac{0+0}{0+0} = \frac{1}{2}$$

Therefore, the equation of the only horizontal asymptote is  $y = \frac{1}{2}$ 

- 4. (20 pts) Parts (a) and (b) are not related.
  - (a) For what value of b is the following function u(x) continuous at x = 3? Support your answer using the definition of continuity, which includes evaluating the appropriate limits.

$$u(x) = \begin{cases} \frac{8}{2} & \frac{x^2 & 9}{x & 3} \\ \frac{8}{2} & \frac{5x + b}{x} & \frac{7}{x} & 3 \end{cases}$$

By the definition of continuity, u(x) is continuous at x = 3 if  $\lim_{x \neq 3} u(x) = \lim_{x \neq 3^+} u(x) = u(3)$ .

 $\lim_{x/3} u(x) = \lim_{x/3} \frac{x^2}{x} \frac{9}{3} = \lim_{x/3} \frac{(x-3)(x+3)}{x-3} = \lim_{x/3} (x+3) = 3 + 3 = 6$  $\lim_{x/3^+} u(x) = \lim_{x/3^+} (5x+b) = (5)(3) + b = 15 + b$ u(3) = (5)(3) + b = 15 + b

Therefore, u(x) is continuous at x = 3 if 6 = 15 + b, which occurs when  $\begin{vmatrix} b = 9 \end{vmatrix}$ 

(b) The Intermediate Value Theorem can **NOT** be used to guarantee that  $v(x) = \frac{2}{x} + \frac{p}{x+2} = 0$  for a value of x on the interval (1;2). Explain which condition for applying the theorem is not satisfied in this case.

## Solution:

The Intermediate Value Theorem cannot be applied in this case because v(0) is undefined, which means that

v(x) is not continuous on the interval [1;2]

The continuity of v(x) on  $\begin{bmatrix} 1/2 \end{bmatrix}$  is one of the hypotheses for applying the IVT to the given function on the given interval.

(Note that v(1) = 1 and v(2) = 3 together indicate that the other IVT hypothesis does hold)
